none [default view] ▼

Arguments de main ↗

- int argc : Le nombre d'arguments (incluant le nom de l'exécutable)

- `char **argv` : liste des arguments initialisée par le système d'exploitation au lancement du programme

```
#include <stdio.h>
int main(int argc, char **argv)
{
    for (int i = 0; i < argc; i++)
    {
        printf("arg[%d]: %s\n", i, argv[i]);
    }
}
```

Running : `/tmp/jl\_JNw1gv/bin ab cd ef`

```
arg[0]: /tmp/jl_JNw1gv/bin
arg[1]: ab
arg[2]: cd
arg[3]: ef
```

Matrices en C

Comment construire une matrice ?

```
float A[2][2] = {{1, 0}, {2, 3}};
A[1][1] = 4;
```

Une telle matrice sera stockée sur le **stack** (variable locale) ou dans la zone données (variable globale)

Matrices sur le heap ⇌

Comment mettre une matrice 2x2 sur le heap ? ⇌

=====

```
float *matrice1 = (float *)malloc(4 * sizeof(float));  
matrice1[1][1] = 4;
```

```
/tmp/jl_hEULRS/main.c:5:14: error: subscripted value is not an array, pointer, or vector  
    5 |     matrice1[1][1] = 4;  
      |           ~~~~~^~  
1 error generated.
```

Première approche, un malloc par ligne ⇄

C (C17 + GNU extensions)

1 #include <stdlib.h>

2

➔ 3 int main(int argc, char **argv) {

4 float **matrice2 = (float **)ma

5 float *ligne0 = (float *)malloc

6 float *ligne1 = (float *)malloc

7 matrice2[0] = ligne0;

8 matrice2[1] = ligne1;

9 matrice2[1][1] = 4;

10 }

Initialisation d'une valeur ⇌

Comment initialiser la première valeur ? ⇌

```
float **matrice = (float **)malloc(2 * sizeof(float *));
float *ligne0 = (float *)malloc(2 * sizeof(float));
float *ligne1 = (float *)malloc(2 * sizeof(float));
matrice[0] = ligne0;
matrice[1] = ligne1;
matrice[0][0] = 1; // 1
*(matrice[0]) = 1; // 2
*(matrice) = 1;   // 3
```

wooclap

<https://app.wooclap.com/JAPRXX>

Comment faire `matrice[0][1] = 0` ? ⇌

```
float **matrice = (float **)malloc(2 * sizeof(float *));
float *ligne0 = (float *)malloc(2 * sizeof(float));
float *ligne1 = (float *)malloc(2 * sizeof(float));
matrice[0] = ligne0;
matrice[1] = ligne1;
*(matrice + 1) = 0; // 1
*(matrice++) = 0;   // 2
*(matrice[0] + 1) = 0; // 3
```

wooclap

<https://app.wooclap.com/JAPRXX>

Comment faire `matrice[1][0] = 2` ? ⇐

```
float **matrice = (float **)malloc(2 * sizeof(float *));
float *ligne0 = (float *)malloc(2 * sizeof(float));
float *ligne1 = (float *)malloc(2 * sizeof(float));
matrice[0] = ligne0;
matrice[1] = ligne1;
*(*(++matrice)) = 2; // 1
*(*(matrice + 1)) = 2; // 2
*(matrice + 1) = 2; // 3
```

wooclap

<https://app.wooclap.com/JAPRXX>

Libération de la mémoire ↩

L'importance de l'ordre de désallocation ↩

=====

Si la matrice a été créée par

```
float **matrice = (float **)malloc(2 * sizeof(float *));  
float *ligne0 = (float *)malloc(2 * sizeof(float));  
float *ligne1 = (float *)malloc(2 * sizeof(float));  
matrice[0] = ligne0;  
matrice[1] = ligne1;
```

► Comment libérer la mémoire avec free ?

wooclap

<https://app.wooclap.com/JAPRXX>

Toujours free dans le sens inverse de malloc

C (C17 + GNU extensions)

```
1 #include <stdlib.h>
2
3 int main(int argc, char **argv) {
4     float **matrice = (float **)mal
5     matrice[0] = (float *)malloc(2
6     matrice[1] = (float *)malloc(2
7     free(matrice);
8     free(matrice[0]);
9     free(matrice[1]);
10 }
```

ERROR: Invalid read of size 8
(Stopped running after the first error. Please fix your code.)

see [UNSUPPORTED FEATURES](#)undefined

Un vecteur "Java" en C

Première implémentation

```
struct vector_t
{
    int size;
    float *v;
};
```

```
struct vector_t * init(int size, float val) {
```

```
float get(struct vector_t *t, int i) {
```

```
void set(struct vector_t *t, int i, float val) {
```

```
void destroy(struct vector_t *vect) {
```

wooclap

<https://app.wooclap.com/JAPRXX>

Une autre implémentation ...

Toutes les fonctions doivent vérifier leurs arguments et retourner

- -1 en cas d'erreur

- 0 en cas de succès

```
struct vector_t {  
    int length; // nombre d'éléments  
    float *tab; // tableau avec les réels  
};
```

Initialisation ⇄

```
struct vector_t {  
    int length; // nombre d'éléments  
    float *tab; // tableau avec les réels  
};
```

Quels arguments ?

```
/*  
 * @pre  
 * alloue la mémoire pour un vecteur de size éléments  
 * initialisés à la valeur val  
 * @return -1 si erreur, 0 sinon  
 */  
  
int init(int size, float val,  
         struct vector_t v, // 1  
         struct vector_t **v, // 2  
         struct vector_t *v, // 3  
)
```

wooclap

<https://app.wooclap.com/JAPRXX>

Allocation de la mémoire ⇄

```
struct vector_t {  
    int length; // nombre d'éléments  
    float *tab; // tableau avec les réels  
};
```

```
int init(int size, float val, struct vector_t **v)
{
    if ((size < 0) || v == NULL)
        return -1;
    *v = (struct vector_t *)malloc(sizeof(struct vector_t));
    if (*v == NULL)
    {
        return -1;
    }
    (*v)->tab = (float *)malloc(size * sizeof(float));
    if ((*v)->tab == NULL)
    {
        return -1;
    }
    (*v)->length = size;
    for (int i = 0; i < size; i++)
    {
```

► Comment assigner la valeur val au i ième élément ?

```
    }
    return 0;
}
```

wooclap

<https://app.wooclap.com/JAPRXX>

Visualization de init ↗

C (C17 + GNU extensions)

```
15         return -1;
16     (*v)->tab = (float *)malloc(s
17     if ((*v)->tab == NULL)
18         return -1;
19     (*v)->length = size;
20     for (int i = 0; i < size; i++
21     {
22         float *t = (*v)->tab;
23         t[i] = val;
24         // ou *((*v)->tab + i) =
25     }
26     return 0;
27 }
28 int main()
➔ 29 {
30     struct vector_t *ptr = NULL;
31     int err = init(4, 1.23, &ptr)
32 }
```

Stack

main

ptr

pointer to vector_t
?

err

Step 1 of 26

Visualized with pythontutor.com

Récupération d'un élément ↗

```
struct vector_t {
    int length; // nombre d'éléments
    float *tab; // tableau avec les réels
};
```

```
/*
 * @pre
 * @post retourne le ième élément du tableau dans val
 *       -1 en cas d'erreur, 0 sinon
 */

int get(struct vector_t *v, int i,
        float val // 1
        float **val // 2
        float *val // 3
) {
```

► Comment implémenter get ?

wooclap

<https://app.wooclap.com/JAPRXX>

Modification d'un élément ↗

```
/*
 * @pre
 * @post place val comme ième élément
 *       du tableau
 *       -1 en cas d'erreur, 0 sinon
 */

int set(struct vector_t *v, int i,
        float val // 1
        float **val // 2
        float *val // 3
) {
```

► Comment implémenter set ?

wooclap

<https://app.wooclap.com/JAPRXX>

Libération de la mémoire ↗

Comment libérer la mémoire quand le vecteur est devenu inutile ?

```
/*  
 * libère la mémoire utilisée pour le vecteur  
 * -1 en cas d'erreur, 0 sinon  
 */
```

```
int destroy(struct vector_t *v) {
```

wooclap

<https://app.wooclap.com/JAPRXX>

Pointeur de fonction ↔

mapreduce donne un exemple de fonction d'ordre supérieur en C

C (C17 + GNU extensions)

```
1 #include <stdlib.h>
2 #include <stdio.h>
3
4 int square(int a)
5 {
6     return a * a;
7 }
8 int plus(int a, int b)
9 {
10    return a + b;
11 }
12
13 int mapreduce(int (*f)(int), int
14 {
15     for (int i = 0; i < len; i++)
16     {
17         init = op(init, f(vec[i])
18     }
```

Retourner un tableau ↗

Heap ou stack ? ↗

.....

Laquelle de ces deux fonctions présente une façon correcte de retourner un tableau ?

```
int *stack()
{
    int v[] = {1, 2, 3};
    return v;
}

int *heap()
{
    int *v = (int *)malloc(3 * sizeof(int));
    v[0] = 1;
    v[1] = 2;
    v[2] = 3;
    return v;
}
```

wooclap

<https://app.wooclap.com/JAPRXX>

Print output (drag lower right corner to resize)

```
1 2 3\n
```

Heap

```
pointer to int
NULL (0x0)
```

C/C++ [details](#): none [default view]

Next >

```
ERROR: Invalid read of size 4
(Stopped running after the first error. Please fix your code.)
```

Structure différente du stack et heap ↩

- Stack : Pile de mémoire locale des fonctions, structure connue à la **compilation**
- Heap : Alloué et désalloué avec des tailles connues à l'**exécution**. L'OS fait de son mieux pour organiser cette mémoire et réassigner les fragments formés suite aux désallocations
